## INTRODUCTION

As knowledge in any field grows, the tools that are to aid in making effective use of that knowledge and that are to stimulate further advances must be modernized. Among the most useful tools in the field of entomology are up-to-date catalogs of the various major groups of insects. They unlock the door to the vast store of published information pertaining to any particular species or form, and they clarify the relationships that species bear to one another. Such a modern catalog of the North American insects of the order Hymenoptera, which includes the sawflies, wood wasps, parasites of other insects that are used in biological control undertakings, bees, wasps, ants, gall wasps and related forms, has long been needed. The last regional catalog of this type was that by Cresson, published in 1887, although the North American species were included in the catalog of the known Hymenoptera of the world, by Dalla Torre, which was published in Germany in 10 volumes, between 1892 and 1902.

During the past 50 years several thousand new North American species have been described and named. Many more have been assigned to genera different from those in which they were originally described; numerous others have been found to be synonyms of previously described species; and still others have had to be renamed because of prior use of the same names for different species. Moreover, many species and genera, the names of which had been wrongly applied, have had to be redefined to correct misidentifications. New genera, too, have been established, and the classification not only of genera and species, but also of tribes, subfamilies, and families, has been appreciably altered. All this is the result of continued research which has grown increasingly critical and is continually adopting new approaches and applying new techniques.

The present contribution represents an attempt to bring together

that information in readily usable form. It had its inception in 1946 when three specialists in the Division of Insect Identification, U. S. Bureau of Entomology and Plant Quarantine, undertook to organize a cooperative effort in which participation by the foremost workers in the various groups of Hymenoptera was enlisted, and which had as its objective the preparation of a sound and authoritative synoptic catalog of the known insects belonging to this order that occur in America north of Mexico. At the outset it seemed doubtful that the efforts of more than 20 different and widely scattered taxonomists, all busily engaged with the work and problems of their respective positions, could be coordinated so as to insure completion of the projected catalog within a reasonable period. The cooperation on this undertaking, however, has been extraordinary; and when funds for publication became available, all individual contributions could be rather promptly completed and assembled and could be put into required form with a minimum of effort.

The specialists who participated in the development of this catalog and who are recorded as authors of the sections for which they were responsible are the following: W. G. Bodenstein, G. E. Bohart, R. M. Bohart, B. D. Burks, Howard E. Evans, Paul D. Hurd, Karl V. Krombein, E. Gorton Linsley, William R. M. Mason, C. D. Michener, W. W. Middlekauff, C. F. W. Muesebeck and Luella M. Walkley (joint contributions), W. D. Murray, Oswald Peck, D. T. Ries, Hugo G. Rodek, H. H. Ross, H. A. Scullen, M. R. Smith, L. J. Stannard, Henry K. and Marjorie Townes, and L. H. Weld. In addition invaluable assistance was given by a number of other specialists in Hymenoptera, notably A. B. Gahan and P. H. Timberlake.

## ARRANGEMENT SUPERSPECIFIC CLASSIFICATION

An attempt has been made to record all the forms, with their synonyms, described from, or known to occur in, the political divisions of the United States, Canada, Alaska, and Greenland. The arrangement is systematic for subgenera and higher groups in so far as our present knowledge and the limitations of a linear arrangement permit. The generic and subgeneric concepts represented in this arrangement rest upon what are believed to be correct genotype designations. In each instance the genotype is cited together with the authority for the selection. Where genotype designations have been found to be invalid under the International Rules of Zoological Nomenclature, new genotype designations, believed to be valid, are given in the catalog. Generic synonymy is included under the generic headings except where subgenera are recognized, in which cases such synonymy is given under the subgeneric names, and references to revisional papers are listed under the appropriate generic, tribal, subfamily, or family headings.

## TRIVIAL NAMES

Within the genera and subgenera the arrangement of species is alphabetical. Where subspecies are recognized the subspecific names are placed in alphabetical order under the species to which they belong; and varieties are listed under the species in which they occur except that varieties of subspecies are placed under the particular subspecies in

which they were described. In each case the specific, or other trivial, name is followed by an indication of the known distribution, and by brief statements showing hosts or prey or preferred habitats, where such information is available and significant. Much of the information on synonymy, distribution, hosts or prey preferences and habitats has hitherto been unpublished. The type localities are recorded for those forms that are known only from the localities where the type specimens were obtained. Otherwise the distribution is usually shown by states and provinces, or by the use of the faunal zones.

## MAP OF FAUNAL ZONES

The map of faunal zones (frontispiece) is an adaptation by Arthur D. Cushman of the U. S. Biological Survey's Fourth Provisional Zone Map of North America, 1910, by C. Hart Merriam, Vernon Bailey, E. W. Nelson, and E. A. Preble. The only changes, other than those occasioned by the use of symbols instead of colors for the various zones, have been the addition of a small area of Tropical Zone at the extreme southern tip of Texas and a rezoning of Alaska on advice received from R. I. Sailer. It should be emphasized that with so great a reduction as used in the reproduction of this map, it has been necessary to represent narrow extensions and certain small isolated areas of some of the zones as more extensive than they actually are.

## ABBREVIATIONS AND SYMBOLS

The abbreviations and arrangement of titles of journals used in this work are essentially those recommended in United States Department Agriculture Miscellaneous Publication 377, 1939. Certain other abbreviations and symbols used in the catalog are explained as follows:

(!) = *lapsus* or misspelling of a scientific name.

"♂" = ♀ or "♀" = ♂ = incorrect sex determination.

♂ (♀ misdet.) or ♀ (♂ misdet.) = only one of sexes described belongs to the species catalogued.

emend. = emendation.

n. comb. = new combination; used after a specific or infraspecific heading to indicate a new generic assignment.

n. name = new name; used after a specific or infraspecific heading to indicate a new substitute name for a homonym; used after bibliographic citation to indicate a substitute name proposed earlier for a homonym.

n. status = new status; used where a form is here accorded a rank different from that which it had previously.

n. syn. = new synonymy; used after generic or specific bibliographic citations to indicate a new synonym.

preeoc. = preoccupied; used after a generic or specific citation to indicate a homonym.

The faunal zones and their divisions are also abbreviated wherever used. The abbreviations are explained as follows:

Bor. = Boreal

Canad. = Canadian

Huds. = Hudsonian

Transit. = Transition

Austr. = Austral  
 U. Austr. = Upper Austral  
 L. Austr. = Lower Austral  
 Austrorip. = Austroriparian  
 Carol. = Carolinian  
 Sonor. = Sonoran

## SCOPE

This catalog has been prepared with much care and it is thought to include all essential material published through 1949. It must be recognized, however, that in the field of taxonomy no contribution can long remain up-to-date. New forms are continually being discovered, and further research is constantly necessitating adjustments in concepts and in classifications. Within such unavoidable limitations it is hoped the catalog will be useful in many different entomological activities, and that it will stimulate young workers possessing an aptitude for taxonomy to take up the study of the fascinating and economically important insects that make up the order Hymenoptera.
